Keywords: military-civilian integration, fast food, security model, more economical, more professional, developed more effectively

Abstract: As the saying goes, "the soldiers and horses go before the food and grass", ensuring three meals a day, whether it is in the physical recovery or spiritual comfort of the personnel of the organizational unit, plays a vital role. Food plays an extremely important role in ensuring the emergency needs of the establishment unit's diet, but it has certain deficiencies in terms of even food, hot food and nutrition. The construction of fast food security model under military-civilian integration can be more economical, the construction of fast food security model under military-civilian integration can be more professional, and the construction of fast food security model under military-civilian integration can be developed more effectively. Research on the guarantee of fast food in units.

1. Introduction

The traditional diet of making rice in a pot has a good guarantee of food quality, but it has many links, slow efficiency and poor concealment. Therefore, the model of fast food security is emerging. This security model can effectively improve the timeliness, accuracy and flexibility of dietary security under special conditions, and is conducive to adapting to the ever-changing environmental situation. It is a revolutionary innovation for dietary security under special conditions [1].

However, it is limited to rely only on the internal strength of the institutional unit to promote the fast food guarantee mode of diet. Food security has a strong military and civilian versatility, and is more closely related to the national economy and society. The food security of the organizational unit and the local catering service have their own characteristics. The food security of the former organizational unit has played a huge role in the development of the organizational unit and the health of the personnel. However, with the development of the economy and the continuous innovation of technology, the dietary guarantee model of the institutional units has lagged behind the vigorous development of the local catering industry. The construction of fast food model has pointed out a clear direction: military-civilian integration [2].

2. The Construction of Fast Food Security Model under the Integration of Military and Civilian Can Be More Economical

First, relying on local catering companies to establish a fast food security model can reduce the

investment of personnel. The procurement of materials and the preparation of food all require the participation of a large number of personnel. Some officers and soldiers are not only combatants but also cooks, which not only increases the burden of officers and soldiers, but also is not conducive to the improvement of the ability and quality of officers and soldiers. Therefore, professional things are still left to professional people. The fast food guarantee under the integration of military and civilians can reduce staff and increase efficiency, effectively improving the combat effectiveness of the organizational units [3].

Second, relying on local catering companies to establish a fast food guarantee model can reduce the investment in financial and material resources. A new type of security model involves personnel training, equipment purchase, maintenance, warehousing and transportation, etc. It requires a lot of financial and material resources to be in place. After relying on local catering companies, the cost of this part of the initial investment is borne by the catering companies, and we only need to pay for the catering products. It is beneficial to reduce security costs and save security funds [4].

Third, relying on local catering companies to establish a fast food guarantee model can reduce the investment in venues. Warehousing, production and processing workshops all need to occupy land, which is obviously not conducive to the long-term development of organizational units under the premise of increasingly tight land. The fast food guarantee under the military-civilian integration does not need to occupy the land of the organizational unit, which is also in line with the regulations on the economical and intensive use of land.

3. The Construction of Fast Food Security Model under the Integration of Military and Civilian Can Be More Professional

First, the taste can be popularized, and the adaptability can be wide. A fast food company that can exist and grow must be a catering company that is accepted by the public. In addition, fast food adopts a chain operation model, which determines that it should be produced and operated in a relatively wide area. Therefore, his products are popular in taste and have the ability to produce different flavored foods. Therefore, the catering products provided by fast food companies are more acceptable, the taste is more suitable for the requirements of officers and soldiers, and the taste can be relatively stable and controllable.

Second, the standardization and patterning of fast food. Under special conditions, personnel face complex situations, consume a lot of mental and physical strength, and have high nutritional requirements, which also puts forward higher requirements for dietary security: the diet that needs to be provided can be selective, and the basis for selection is the standard. One of the principles of the operation of local fast food companies is standardization. Standardization is to facilitate the replication of the chain operation model, to facilitate the management and control of the franchise system or to maintain the consistency of the entire chain operation system. Moreover, under standardized conditions, the diet products produced have more reasonable nutrition. Because, according to the actual needs, reasonable matching can not only meet the needs of energy, but also meet the special needs of certain nutrients in special environments, which is more hygienic and safer. The state has very strict supervision and management measures for the food safety of the catering industry. Fast food businesses are also regulated. Therefore, fast food products provided by large fast food chains should be more hygienic and safer.

Third, eating can be more convenient and faster. The factory production of fast food is fast, and the logistics and distribution are fast. Therefore, for personnel in special periods, it can be taken at any time, and it is convenient to eat, which can meet the requirements of the establishment unit under the conditions of emergency maneuvering and so on. This ensures that the organizational unit is converted from normal to special periods, and ensures uninterrupted food supply in special

periods.

4. The Construction of Fast Food Security Model under Military-Civilian Integration Can More Effectively Develop Military-Civilian Integration Development

Military-civilian integration is a strategy for rejuvenating the country. In peacetime, the faster the pace of military-civilian integration, the more opportunities for development will be won [5]. The military-civilian integration of food security has taken the lead in other fields, and the socialization of social security for the establishment is a good example of military-civilian integration. Established units have achieved good security benefits in both normal security and special period security [6]. Under special conditions, the fast food security model is about to become dominant, and this security model will continue to develop and improve with the continuous development of the social economy and the emergence of high-tech [7-9].

First, the level of economic development promotes the continuous development of fast food companies. Fast food is the product of social and economic development to a certain stage, and the growth rate of social economy promotes and restricts the development of fast food industry. With the rapid development of China's economy and society, the urbanization process is accelerating, and people's lifestyles and living patterns have undergone fundamental changes. Driven by many favorable factors, the fast food industry will develop more vigorously.

Second, the pursuit of economic interests promotes the continuous development of fast food companies. The essence of business is to find needs, create value, meet needs, and get returns. The premise of obtaining returns is to be able to meet the needs of customers well. Whether it is to meet the needs of the army for fast food or to meet the needs of ordinary customers in the society, fast food companies must constantly improve themselves and make breakthroughs. Otherwise, the natural law of survival of the fittest will eliminate companies that follow the old ways and rest on their laurels.

Third, the emergence of high technology has prompted the continuous development of fast food companies. Modern science and technology have promoted the improvement of fast food industry technology, shortened the development cycle of new products of enterprises, accelerated the replacement of products, and greatly improved the competitiveness of fast food products. Technological innovation not only has a direct impact on the productivity and product development speed of catering enterprises, but also has a huge impact on the public's consumption concept and consumption habits [10,11].

For example, under the background consumption mode of "Internet +", consumption is more interactive, rational and sharing, and even the consumption boundary is cancelled. It has had a huge impact on commodity production, market circulation, and business sales, and has gradually evolved into a new normal for consumption patterns. As the saying goes, the people are used by the army, and the army promotes the development of the people. The fast-food security model under the integration of military and civilians will promote the continuous improvement of fast-food enterprises and increase their competitiveness, and become a part of the dietary security of the established units in normal times and special times. With the participation of local fast-food enterprises, the dietary guarantee of institutional units is more economical and more complete.

5. Conclusion

This paper proposes that the construction of fast food security model under military-civilian integration can be more economical, the construction of fast food security model under military-civilian integration can be more professional, and the construction of fast food security model under military-civilian integration can be developed more effectively.
