Abstract: The government's public management policy not only embodies the ruling will of the ruling class, but also shows the national will of a country, but fundamentally reflects the will of the broad masses of the people. These wills themselves need an authoritative, fair and equitable distribution of public interests. How to realize the sustainable and healthy development of public management policy resources under the new situation is a prominent problem we are facing today. Therefore, this paper attempts to study the development of public management policy resources of our government from the perspective of sustainable development. Constantly improve infrastructure construction; Through the transformation and upgrading of existing enterprises, we can guide the agglomeration of other industries in the industrial chain. In addition, we should strengthen the construction of evaluation mechanism for enterprise production activities. Being responsible for the whole society is the requirement of objective laws, and the development and utilization of government public management policy resources should earnestly reflect the requirements of the whole society. It can be seen that the development of government public management policy resources under sustainable development is an important way to optimize government public management policy.

1. Introduction

The government's public management policy refers to the routes, principles, rules and measures determined by public organizations representing public interests in accordance with the law in order to effectively increase and authoritatively distribute public interests and manage and serve public affairs in a certain time and space. The government's public management policy not only embodies the ruling will of the ruling class, but also shows the national will of a country, but fundamentally reflects the will of the broad masses of the people [1]. These wills themselves need an authoritative, fair and equitable distribution of public interests. In order to satisfy their infinite desire as higher animals with advanced thinking ability and make life "better and better", human beings constantly invent and create technical systems with strong production capacity, ask for more and more original resources from nature, and then process and transform them according to our needs to become our consumer goods to meet our material and spiritual needs, and throw them back to nature after use [2]. Sustainable development shows the dialectical relationship between environment and development, that is, environment and development are inseparable and complement each other. The overall interests and long-term interests of the executors should be consistent with those of the superiors. Relative to the central authorities and superiors, local interests are local interests and short-term interests, while relative to the local authorities, they have overall interests and long-term interests, but such interests must conform to the overall interests and long-term interests of the central authorities and superiors. How to realize the sustainable and healthy development of public management policy resources under the new situation is a prominent problem we are facing today. Therefore, this paper attempts to study the development of public management policy resources of our government from the perspective of sustainable development. In the process of ensuring the coordinated development of economic society and the utilization of public management policies,

the dynamic continuity of the development of public management policies in time and space is maintained, so that the development and utilization of today will not damage the development and utilization ability of future generations [3]. Since the government public management policy is an authoritative distribution of public interests, whoever gets the government public management policy will get certain public interests, so the government public management policy is a very important resource [4]. The law of the times reflected by the government's public management policy is appropriate on the whole, but it may be slightly conservative for a certain local area, so this relationship should be handled correctly. The executor should further formulate and implement the government public management policy in line with the local reality in accordance with the spirit of the government public management policy. The development of government public management policy resources under sustainable development is an important way to optimize government public management policy.

2. Understanding of Government Public Management Policy Resources and Their Development from the Perspective of Sustainable Development

2.1. Understanding the Development of Government Public Management Policy Resources

The development of the economy and society is not a temporary existence but a long-term development process. Whether it is the utilization of the natural environment or the extraction of natural resources, it should be viewed from the perspective of sustainable development, which is the foundation of human future survival[5]. The development of government public management policy resources under sustainable development is the process of restructuring and integrating government public management policy wealth, forming new and useful structures and functions, including the re-optimization and integration of government public management policy resources themselves, the cleaning up of outdated government public management policies, and the regeneration of appropriate and useful government public management policies. While comprehensively accelerating the construction of a moderately prosperous society, we must attach great importance to the negative effects of population, resources, and environment on economic and social development, establish a scientific development, resource, and consumption perspective, and coordinate regional development, urban-rural development, economic and social development, and harmonious development between humans and nature[6]. Only in this way can we ensure the sustainable development of the region. The government, based on public management and environmental carrying capacity, and in accordance with economic and social laws and ecological environment laws, utilizes legal, administrative, economic, technological, educational and other means to comprehensively and systematically plan and optimize public management. Under sustainable development, the government adjusts and controls public management to ensure the development and utilization of resources and the harmonious and sustainable development of the economy and society[7-8]. The government implements and formulates government public management policies under the leadership, command, and control of the central government and higher-level governments, which is the development and utilization of government public management policy resources. Driven by the interests of the executors, the development and utilization of government public management policy resources will have significant differences in effectiveness.

2.2. Understanding of government public management policy resources

Administrative resources refer to the existing and existing administrative wealth in the administrative system, which is a kind of social wealth. It includes three parts: material entities, that is, government administrative agencies, administrative personnel, equipment and facilities and other property; Non-material entities, namely administrative systems, policies and regulations; The functions of material and immaterial entities, that is, government administrative ability, authority, influence and appeal [9]. It can be seen that the sustainable development of industry in resource-based cities is of great significance, which directly affects the economic development and social

progress of resource-based cities. However, no matter what type of resource-based cities, the finiteness of natural resources has determined the inevitability of urban industries. From the technical characteristics of human production activities and the carrying capacity of the ecological environment itself so far, the natural ecological environment has saturated or even overloaded the absorption capacity of production waste. To continue to use it for production, it is necessary to regenerate and output new environmental capacity, which requires human resources to "make ecological restoration and pollution control" [10]. That is, a good natural ecological environment has become the "product" of human labor. The process of reorganizing and integrating administrative wealth to form a new and useful structure and function includes re-optimizing, combining and utilizing the material resources of administrative resources, cleaning up the outdated old administrative culture and functions, subliming the appropriate and useful administrative culture and functions, and more importantly, innovating the immaterial entities of administrative resources such as systems, policies and regulations.

3. Research on the Responsibility of Government Public Management Policy Resource Development from the Perspective of Sustainable Development

3.1. Responsible for the law

Once a law is established, it has authority, enforceability, and relative stability. Although it can be modified or changed, such modification must be carried out in a certain legal form before it can be recognized. The established and revised legal rules are the norm for all behavior, and anyone and anything must be responsible for the law, otherwise they will bear legal responsibility. The focus of public management research has shifted from an administrative perspective to a management perspective, incorporating market-oriented competition mechanisms into the management of the public sector, and fully utilizing the innovative development concepts and advanced management methods of the private sector to develop a market economy, breaking the monopoly of the government, improving the efficiency of government services, and creating a new model of government management as an "entrepreneur". The economic development of a region mainly depends on its investment environment, whether it can attract a large number of market entities to invest and start businesses, and transforming and changing the services of government functional departments has become an important prerequisite for creating a good investment environment in various regions. Within the scope of legal rules, the executors of the law have a significant impact on the effectiveness of law enforcement, which is formed by the power relationship between individuals holding positions within the legal system.

3.2. Responsible for the entire society

Social laws are objective, and there is a process for the public and owners to know, understand and grasp them, which shows that the laws made by the public, owners and them do not always represent and reflect the laws and interests of the whole society. Intensify efforts to promote the coordinated development of public management policies and resource development. Urban planning should proceed from the perspective of sustainability and should be examined and approved on the basis of considering the overall urban development plan. Paying the cost of reform, promoting the transformation of state-owned enterprises, expanding the coverage of social security, developing urban continuing industries, alleviating employment pressure and ensuring social stability are unavoidable practical problems for resource-exhausted cities to build a well-off society in an all-round way. Actively promote the construction of development bases, standardize enterprise production areas and citizen activity areas, and improve the ecological environment on which the people depend. Constantly improve infrastructure construction; Through the transformation and upgrading of existing enterprises, we can guide the agglomeration of other industries in the industrial chain. In addition, we should strengthen the construction of evaluation mechanism for enterprise production activities. Therefore, it is necessary to handle this relationship well: being responsible for the whole society is the requirement of objective laws, and the development and

utilization of government public management policy resources should earnestly reflect the requirements of the whole society.

3.3. Responsible for the consequences

Because the development and utilization of government public management policy resources have a great impact on social development, its positive impact is the goal pursued by governments at all levels, which makes society develop continuously and the cost required by society is very low. However, the government's public management policy will also have a negative impact, that is, the backwardness and loss caused by the government's public management policy to society, as well as the inefficiency of social development and government management. The unity and transparency of administration according to law are not high, the government's administrative behavior is not standardized, it lacks openness to society and citizens, and phenomena such as "arbitrary charges, arbitrary apportionment and arbitrary fines" occur from time to time. Strengthen financial support for cultural construction, basic scientific research and technological development; Increase the construction and supply of infrastructure, strengthen environmental protection and so on. The inefficiency of the government's public management policy is also a social loss and waste, because the formulation and implementation of the government's public management policy itself requires costs, even if it has no social role, it has already consumed costs. At present, the reality of China requires that the effectiveness and responsibility of the development and utilization of government public management policy resources must be organically unified.

4. Conclusions

The formulation and implementation of government public management policies only focus on their own goals and interests while neglecting the interests of the executors, which is not conducive to the development and utilization of government public management policy resources. At the same time, the government should promote the legal construction of intermediary organizations, accelerate legislation, establish a sound legal system, and set up supervisory and law enforcement agencies that are suitable for the healthy development of market intermediary organizations, so that the activities of intermediary organizations can truly be based on laws and must be followed. We need to further transform the government's functional approach, strengthen policy regulations, and promote the optimization, upgrading, and structural diversification of traditional industries through interest guidance. From the perspective of sustainable development, further strengthen the government's social functions, strengthen social management and public services, in order to solve the problem of public service arrears and deficiencies. Enhance the public service awareness of administrative agencies, continuously improve the efficiency of public services, and effectively solve the relationship between the government and enterprises, the government and the market, and the government and society. Effectively transform government functions and entrust social organizations such as intermediary agencies or industry associations with tasks that the government should not do or cannot do well. Under the guidance of sustainable government public management policies, the full development and utilization of government public management policy resources can achieve the effectiveness of the development and utilization of government public management policy resources. Otherwise, the responsibility for the development and utilization of government public management policy resources should be borne and corresponding accountability should be pursued.
