Keywords: Ecological Civilization Construction, Environmental Governance, Green Economy, Core Values

Abstract: the Construction of Socialist Ecological Civilization is an Important Part of China's Modernization Construction. This Paper Makes a Preliminary Exploration from the Connotation, Characteristics and Objectives of the Construction of Ecological Civilization, and Then Analyzes the Achievements and Shortcomings in the Aspects of Environmental Governance and Green Economy, and Finally Looks Forward to the Construction of Ecological Civilization in the New Era. We Can Insist on Three Ways to Explore the Chinese Plan of Ecological Civilization Construction: to Improve the Public Awareness of Ecological Protection, to Realize the Harmonious Coexistence of Man and Nature, to Adhere to the Socialist System of the Whole Ecological Environment Protection System, and to Promote the Sustainable and Healthy Development of Economy from Economic Rationality to Ecological Rationality.

1. Introduction

1.1 Ecological Civilization Construction

With the Rapid Development of New China, People's Living Standards Have Been Greatly Improved, and the Construction of Ecological Civilization Has Also Been Paid More and More Attention by the Government and the Masses. for Ecological Civilization[1], Human Beings Respect and Protect the Ecological Environment, Carry out Human Activities and Achieve Further Development without Destroying the Ecosystem. Ecological Civilization is the Return and Deepening of a Higher Level of Ecological Mode. We Do Not Want to Return to the Original Civilization and Agricultural Civilization, But Return to the Harmonious Relationship between Man and Nature on the Basis of Modern High Level of Material Production.

1.2 Characteristics and Objectives of Ecological Civilization Construction

The construction of ecological civilization of socialism with Chinese characteristics includes three characteristics. Individuals can try their best not to litter, save water and electricity, and choose more public transport. The construction of ecological civilization has the characteristics of multi link participation. The individual level can participate in the construction of ecological civilization from daily life, which has been reflected in the previous characteristics; the enterprise level requires the elimination of backward economic development mode, the introduction of energy conservation and environmental protection technology and related scientific and technological talents; the social level strengthens the publicity of ecological civilization construction, and trains a good social atmosphere; the legal system level improves the corresponding laws and regulations, plus Strengthen the supervision and management of enterprise and individual behaviors. The construction of ecological civilization also has the characteristics of sustainability[2]. Human civilization is conceived by nature. If human civilization wants to make great progress, it must always put the protection of ecological environment in an important position. Therefore, the construction of ecological civilization is not a phased task, but a continuous task, which needs to be continued in the process of economic and social development.

The construction of ecological civilization requires the protection of ecological environment in

the process of the development of human society, the persistence of energy conservation and environmental protection economy, and the realization of harmonious coexistence between man and nature. The construction of ecological civilization should first improve people's awareness of ecological civilization.

2. Achievements

The protection of ecological environment in the protection of ecological environment, China has made a number of gratifying results. In the aspect of water area control, we put an end to the way of reclaiming land from lakes, and strengthened the control of water area pollution.

Since the founding of new China, especially in the 21st century, China has accelerated the promulgation and implementation of relevant laws and regulations. According to the legal gaps encountered in the process of ecological civilization construction, the state is constantly filling and improving. Related to it, the channels for reporting illegal acts are also expanding. At present, individuals can report all kinds of environmental violations through various channels, such as the Internet, hotline, and direct reporting to relevant departments[3].

The development of green economy is reflected in all levels. At the social level, the awareness of garbage classification is constantly improving, so the resource recycling becomes more convenient; at the enterprise level, the development of energy-saving energy has been strongly supported by the government, for example, electric vehicles have been more and more popular; at the family level, solar energy furniture has become more and more popular, and many families in the countryside have begun to use biogas. This kind of convenient and clean energy, ecological agriculture is gradually popularized in the vast rural areas, effectively improving the environment and benefiting the farmers. As shown in Figure 1

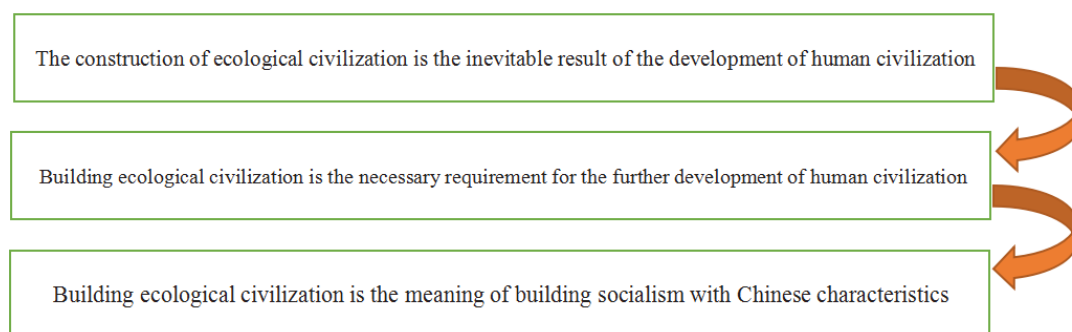

Fig.1 The Idea of Building Ecological Civilization

3. Deficiencies

The construction of ecological civilization in China has made great progress, but we still need to realize clearly that there are still some problems.

3.1 Insufficient Supervision

Although the laws related to the construction of ecological civilization in China are constantly improving, some problems such as environmental pollution and ecological damage occur from time to time due to the lack of supervision awareness and supervision channels of a few managers. On the other hand, the environmental protection department is unable to carry out effective supervision due to insufficient law enforcement[4], and some pollution enterprises and environmental protection departments have problems of interest transmission, which also needs to be reflected by the government departments. The situation that polluting enterprises stop work in the process of environmental inspection and resume production after inspection has been repeatedly forbidden and needs to be eliminated.

3.2 Some Backward Production Modes Still Remain Unchanged

In the process of economic development, nature is always demanded. China has realized that it can't take the route of "pollution before treatment", so it pays great attention to environmental protection in the process of economic development. However, many enterprises for economic interests, still for the immediate interests regardless of the damage to the environment. For example, in recent years, the problem of sewage discharge, as well as the increasingly serious problem of air pollution, has been frequently exposed.

3.3 The Mechanism to Deal with Environmental Pollution Events is Not Perfect

In recent years, there have been a number of major environmental pollution emergencies in China, most of which are caused by safety responsibility production accidents. On the whole, China's response mechanism to environmental pollution events is not perfect, and the situation of environmental governance is still grim[5].

4. Ecological Civilization Thought of Ecological Socialism

So as to build a new socialist society in which man and nature live in harmony and move towards unity in mutual blending.

People and nature tend to be unified in their interaction in the green movement. People hold two views. One is ecocentrism. People who hold the view of ecocentrism think that nature is in the highest position in the relationship between human and nature, and human beings should obey nature unconditionally. Because nature is prior to human existence, nature is higher than all human beings, and no one can resist nature. Second, technology centralism. People who hold such views believe that human beings are the most intelligent creatures, and exist higher than nature. The eco socialists put forward their own brand-new views on the two views of green movement. They think that in order to solve the current ecological crisis, people and nature must be unified in mutual communication. Human society is a part of nature[6]. As Grundman said, human survival has to rely on nature, but human beings transform nature subjectively and actively by means of technology to meet the needs of human survival. It is impossible for human beings to exist independently. At the same time, nature is humanized nature. Only under the development and utilization of human beings can nature give full play to the role of natural resources. On the other hand, society and nature interact and blend with each other. Nature restricts human activities to a certain extent. In turn, human beings can change nature through their own subjective initiative, and the changed nature can further affect human development. Such reciprocation, man and nature in such mutual communication, mutual influence process gradually toward unity.

Capitalist system is the root of ecological social crisis. Ecological socialism thinks that capitalist mode of production is the important reason of ecological crisis. Ecological socialism explores the deeper relationship between man and nature through the surface of man and nature. It will reduce the cost of enterprises as much as possible and pursue the minimization of the cost, no matter how much the cost is borne naturally. In order to make the most profit, they try to pass on the cost to the future and future generations. Although some capitalists may also invest in ecological environment protection, their behavior is based on a certain premise, that is, to ensure the continuous growth of profits, to continuously improve the profits of enterprises, and to pursue the ultimate goal of capitalist pollution control is also to achieve their profit pursuit.

The economic standard of profit maximization pursued by capitalism must be subordinated to the ecological standard of society, which is the fundamental difference between ecological socialism and other models. Ecological socialism has shifted people's attention from the aspect of economic benefits. People's economic activities and social behaviors are no longer only concerned about the final profits they can obtain, but can integrate the three aspects of economy, society and ecology organically to achieve economic development. For production, we should not only pursue "quantity" to win, but also take "the least but the best production" as the basic standard of commodity production. Every era must pursue economic development, and the pursuit of economic

efficiency itself is no problem. Ecological socialism is to emphasize that, on the premise of maintaining economic development, we should realize the requirements of ecological development as much as possible and ensure the steady progress of economy.

5. Enlightenment of Ecological Socialism on the Construction of Ecological Civilization of Socialism with Chinese Characteristics

The people are the backbone of the construction of socialist ecological civilization. First of all, we must expand the scope of publicity. At present, in this society of economic supremacy, many people judge things by whether they can bring economic benefits for themselves, regardless of other factors, such as whether the ecological environment will be polluted. Therefore, the national government must strengthen the publicity in this regard[7], and arouse the public's awareness of the importance of the ecological environment. Integrating environmental protection into people's daily life makes it an independent and conscious behavior. Secondly, we must correct people's wrong ideas. Many people are influenced by the "Anthropocentrism" and mistakenly believe that in the relationship between human and nature, human beings are in an absolute dominant position, and they have the right to rule nature and make any changes to nature. The emergence of contemporary ecological crisis has broken people's dream. The absolute rule of human beings over nature puts human beings and nature on two opposite sides. Only in the process of using the environment can people not destroy the environment and finally realize the harmonious coexistence of human beings and nature.

Adhere to the socialist system, so for our country, we must unswervingly adhere to the socialist system, under the leadership of the Communist Party of China, contribute to the world's ecological environment protection. Relevant policies[8], laws and regulations must be issued to strengthen the protection of the environment and restrict the occurrence of environmental damage. "The construction of ecological civilization is the fundamental plan for the sustainable development of the Chinese nation." In recent years, the Central Committee of the Communist Party of China has successively issued policies on the issues of ecological environment protection, pointing out the direction for the construction of ecological civilization in China. The 18th National Congress of the Communist Party of China put "ecological civilization construction" into the five in one overall layout, which shows the importance of the construction of ecological civilization. China has made a positive response to the global ecological crisis. In the future development, we must continue to adhere to and not relax, so as to make our ecological environment protection system more complete.

To promote the sustainable and healthy development of economy and transform from economic rationality to ecological rationality, Goz, a famous ecosocialist, believes that in the process of "ecological reconstruction", we must "reorient economic rationality" and "build a society in which people live better but work and consume less". This tells us that we must abandon the previous mode of "mass production" and absolute economic waste and damage to the ecological environment. Economic interests will no longer be the only standard to measure whether people's behavior is correct, but more importantly, it will depend on what role this behavior will bring to the future and our future generations. "The construction of ecological civilization has the function of one stone and two birds". Economy and environment influence each other and rely on each other. Only when the ecological environment is protected, can it continuously provide the natural resources needed for economic development, so as to promote the sustainable and healthy development of economy. The most important thing for the transformation from economic rationality to ecological rationality is to change the previous view of labor, not only taking labor as a means of making a living, but also being able to obtain happiness and satisfaction in the process of labor. In today's society where the material is basically satisfied, we should not only pay attention to our material life, but also our spiritual life, so as to realize the organic unity of material life and spiritual life[9].

6. Conclusion

Relevant departments also need to focus on the global perspective and contribute to global ecological security. The earth is the common and only home of human beings, and human beings cannot be separated from nature. It is also a win-win result for China to join hands with other countries to develop environmental protection economy.
